

## ECnet Partners GETT to Streamline Supply Chain Processes for Cape Technology using RosettaNet

### Solution

ECnet-GETT RosettaNet eSCM

### Challenges

- To achieve faster response time from the customers to Cape
- To increase information accuracy and automate purchasing processes
- To reduce manual, paper-based processes and increase productivity
- To have a central resource of information

### Results

- Improved speed of information between its suppliers
- Increased information accuracy and automated purchasing processes
- Increased productivity and error reductions
- Organized central resource of information easily accessible

**Cape Technology Sdn Bhd** develops and produces industrial rubber compounding and polymer related products. The company also works together with local universities and government agency for research and development activities. Since inception in 1996, Cape Technology has been serving many semiconductor industries, which produce integrated circuits using molding processes.

As Cape Technology prides itself on delivering quality products at a competitive price, it continually strives to enhance quality control in its manufacturing process while also maintaining accurate records of important process data throughout the entire manufacturing cycle. Thus, it needed a solution that could help it achieve speedy information flow between Cape and its customers. In addition, it needed to achieve faster response time from the customers to Cape while also ensuring that the information is accurate. To increase productivity of its employees, it also needed to reduce the existing manual and paper-based processes as well as have a central resource of information easily available.

### The Solution

With the main objectives of being able to communicate with their trading partners easily via the Internet and also ensuring the information accuracy, Cape Technology selected the ECnet-GETT RosettaNet eSCM application jointly offered by Global Trade Electronic Trade Technologies Sdn Bhd (GETT), a subsidiary of Penang Network Services, and ECnet, under the GETT RosettaNet E-Business Hub initiative.

Launched in June 2003, the GETT RosettaNet E-Business Hub is the result of a partnership between GETT and ECnet, a leading collaborative supply chain solutions provider in the region. GETT manages and operates the hosted RosettaNet eSCM application services co-jointly developed with ECnet to serve the needs of the Malaysian manufacturers, employing best-of-breed technology to assist businesses in rapidly integrating its business processes and automate the exchange of information with multiple business partners.

### The results

The benefits of using the ECnet-GETT solution are that with a common RosettaNet eSCM application being hosted in a central secure location, no heavy investments on hardware, software and technical resources are required, thus also making it highly cost effective and easily integrated. Once fully implemented, Cape Technology can enjoy greater information visibility, speed of information and accuracy while working with their trading partners. With the purchasing processes being automated, Cape Technology can enjoy increased information accuracy as well as increased productivity and error reduction once all the manual, paper-based and time-consuming processes are eliminated. The ECnet-GETT application would also provide a central resource of information easily accessible and visible for Cape and its trading partners. This would result in Cape in achieving better control over its supply chain processes and reduction in its operational costs.
